advanced skin innovations with microneedling

what is micro-needling?

Skin needling is a skincare treatment aimed at improving appearance, texture, and overall quality by boosting collagen and elastin production using a microneedling pen. A micro needling pen is a tool that creates miniscule punctures on the dermal layer of the skin which then triggers a series of reactions that leads to high collagen and elastin production. New Age Skin & Beauty uses the Dermapen 4 which is regarded as the best device in the micro needling industry. After a few sessions of Dermapen treatment, you will notice significant improvements in overall skin condition.

The treatment can be as effective as Fractional laser, chemical peels, IPL and other skin rejuvenation techniques without the significant downtime, making Dermapen a popular treatment.

The principle idea behind Dermapen needling is that micro injuries to the skin promote collagen and elastin

growth as a by-product to healing. Essentially, as your body heals the skin increases the production of collagen and elastin and this production leads to fresher, rejuvenated skin.

Dermapen is used mostly for face wrinkles, scars, stretch marks and facial lines. When one is injured and the skin forms a scar, or if they have a stretch mark the body will treat these as though that area was repaired. Therefore having the punctures created in the scar tissue will cause the skin to initiate healing and, therefore, the damaged skin will tend to get eliminated and replaced with new skin. For wrinkles and face lines, basically, the produced collagen and elastin will cause the skin to thicken and also tighten, leaving the skin looking youthful.

conditions

Conditions effectively treated & managed by a Dermapen procedure

- Collagen Induction Therapy
- Sebhorrhoea
- Ageing/Rhytids (Wrinkles)
- Ultra Violet Damage
- Skin Rejuvenation
- Problematic Acne
- Enlarged/Dilated Pores
- Scarring
- Alopecia
- Ageing/Rhytid (Wrinkles)
- Hyperpigmentation
- Hypopigmentation/Vitiligo
- Keratosis Pilaris
- Problematic Breakouts/Acne
- Rosacea
- Alopecia (Hair regeneration)
- Stretchmarks

does the procedure hurt?

No, it definitely does not hurt. We cover the skin with a generous layer of anaesthetic cream (Topical Local Anaesthetic) which we normally leave on for about 30 minutes. Once the needling begins you may feel a little bit of pressure but that is basically it!. It doesn't matter if you're trying to improve your skin's elasticity, collagen, pore size, acne scars, stretch marks or any other factor, the Dermapen 4 does it faster and with more power and precision – it means less pain, and the results are immediate. There is no surgical intervention which we love. The result is a natural, glowing skin. Just be careful of imitation treatments – there are a number of cheaper copies on the market that don't offer the latest technology and won't give you unparalleled results.

what is the downtime?

Remember that micro-needling causes tiny little injuries to the skin so you will not be able to wear any make-up after a treatment. It is extremely important not to expose your skin to the sun and must take good care of your post and prior treatment to really benefit from this fantastic treatment. There is no downtime, slight redness but that is pretty much it!

how long before we will see results?

Results can be seen after a single session, however we recommend 4-6 treatments 3-4 weeks apart for optimal results.
